```

Problem Support

Set Packing Problem (SPP):

- $J = \{1, \dots, n\}$

- $I = \{1, \dots, m\}$

- $$\left[\begin{array}{l} \text{Max } z(x) = \sum_{j \in J} c_j x_j \\ \sum_{j \in J} a_{i,j} x_j \leq 1, \forall i \in I \\ x_j \in \{0, 1\} \quad , \forall j \in J \\ a_{i,j} \in \{0, 1\} \quad , \forall i \in I, \forall j \in J \end{array} \right] \quad (SPP)$$

Problem Support

Example of a numerical instance:

```
7 6
7 2 4 6 3 1
3
1 2 3
3
2 5 6
3
1 2 4
3
2 3 5
2
4 6
3
3 4 5
2
1 5
```

Format OR-library:

<http://people.brunel.ac.uk/~mastjjb/jeb/info.html>

number of rows (m), number of columns (n)

the cost of each column $c(j), j=1, \dots, n$

for each row i ($i=1, \dots, m$): the number of columns which cover row i

followed by a list of the columns which cover row i

Problem Support

Example of a numerical instance:

$$\left[\begin{array}{lcl} \max z & = & 7x_1 + 2x_2 + 4x_3 + 6x_4 + 3x_5 + x_6 \\ s/c & & \begin{array}{l} x_1 + x_2 + x_3 \leq 1 \\ x_2 + x_5 + x_6 \leq 1 \\ x_1 + x_2 + x_4 \leq 1 \\ x_2 + x_3 + x_5 \leq 1 \\ x_4 + x_6 \leq 1 \\ x_3 + x_4 + x_5 \leq 1 \\ x_1 + x_5 \leq 1 \\ x_1, x_2, x_3, x_4, x_5, x_6 = (0, 1) \end{array} \end{array} \right]$$

Problem Support

Reading a numerical instance:

```
7 6
7 2 4 6 3 1
3
1 2 3
3
2 5 6
3
1 2 4
3
2 3 5
2
4 6
3
3 4 5
2
1 5
```

```
julia> function loadSPP(fname)
julia>     f = open(fname)
julia>     m,n = parse.(Int, split(readline(f)) )
julia>     C = parse.(Int, split(readline(f)) )
julia>     A = zeros{Int, m, n}
julia>     for i=1:m
julia>         readline(f)
julia>         for valeur in split(readline(f))
julia>             j = parse{Int, valeur}
julia>             A[i,j] = 1
julia>         end
julia>     end
julia>     close(f)
julia>     return C, A
julia> end
```

Exercise 0

- ▶ **Solving the SPP instance with a MIP solver**

Modeling the SPP with JuMP, calling your favorite MIP solver

Overview of JuMP

A modeling language for Mathematical Optimization (linear, mixed-integer, conic, semidefinite, nonlinear):

- ▶ **User friendliness:** syntax that mimics natural mathematical expressions.
- ▶ **Speed:** similar speeds to special-purpose modeling languages such as AMPL.
- ▶ **Solver independence:** JuMP uses *MathOptInterface (MOI)*, an abstraction layer designed to provide a unified interface to mathematical optimization solvers.

Currently supported solvers: Artelys Knitro, Baron, Bonmin, Cbc, Clp, Couenne, CPLEX, FICO Xpress, GLPK, Gurobi, SCIP, etc.

- ▶ **Ease of embedding:** JuMP itself is written purely in Julia. Solvers are the only binary dependencies.

Getting Started

Install:

```
julia> using Pkg
```

```
julia> Pkg.add("JuMP")
```

```
julia> Pkg.add("HiGHS")
```

```
julia> Pkg.add("Gurobi")
```

Getting Started

Install:

```
julia> using Pkg
```

```
julia> Pkg.add("JuMP")
```

```
julia> Pkg.add("HiGHS")
```

```
julia> Pkg.add("Gurobi")
```

Getting Started

Install:

```
julia> using Pkg
```

```
julia> Pkg.add("JuMP")
```

```
julia> Pkg.add("HiGHS")
```

```
julia> Pkg.add("Gurobi")
```

Getting Started

Install:

```
julia> using Pkg
```

```
julia> Pkg.add("JuMP")
```

```
julia> Pkg.add("HiGHS")
```

```
julia> Pkg.add("Gurobi")
```

Writing a SPP Model and Solving an Instance

```
julia> using JuMP, HiGHS
```

```
julia> C,A = loadSPP(fname)
```

```
julia> m,n = size(A)
```

```
julia> spp = Model(HiGHS.Optimizer)
```

```
julia> @variable(spp, x[1:n], Bin)
```

```
julia> @objective(spp, Max, sum(c[j]*x[j] for j=1:n))
```

```
julia> @constraint(spp, cst[i=1:m], sum(A[i,j]*x[j] for j=1:n) ≤ 1)
```

```
julia> print(spp)
```

```
julia> optimize!(spp)
```

```
julia> @show objective_value(spp)
```

```
julia> @show value(x[2])
```

```
julia> @show value.(x)
```

Exercise 1

- ▶ **Construct a “good” initial solution**

Iterative procedure: selection parts of a solution until it is feasible

- ▶ **Improve a “good” feasible solution**

Iterative procedure: move from one solution to an other solution as long as required. The solution is the result of a move into a neighborhood structure.

Construction Algorithm

Algorithm 1: Greedy construction

$S \leftarrow \emptyset$

Initialize the candidate set \mathcal{C} , and evaluate the utility $u(e)$, $\forall e \in \mathcal{C}$

while ($\mathcal{C} \neq \emptyset$) **loop**

 Select the current *Best* element e from \mathcal{C} :

$e \leftarrow \max_{e \in \mathcal{C}} u(e)$

 Incorporate e into the solution:

$S \leftarrow S \cup \{e\}$

 Update the candidate set \mathcal{C} and reevaluate the utility $u(e)$, $\forall e \in \mathcal{C}$

$\mathcal{C} \leftarrow \mathcal{C} \setminus \text{conflict}(\{e\})$

endWhile

return S

Example: construction (1/1)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$
	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
$a_{ij} =$	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0

$$\sum_{i \in I} a_{ij} = \begin{matrix} 3 & 4 & 3 & 3 & 4 & 2 \\ u(x_j) = & 2,3 & 0,5 & 1,3 & 2 & 0,75 & 0,5 \\ & \times & & & & & \end{matrix}$$

$\rightarrow j^* = 1$

Example: construction (1/1)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$
$a_{ij} =$	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	3	4	3	3	4	2
$u(x_j) =$	2,3	0,5	1,3	2	0,75	0,5
	\times					

$\rightarrow j^* = 1$

Example: construction (1/1)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$	1
	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
$a_{ij} =$	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	3	4	3	3	4	2
$u(x_j) =$	2,3	0,5	1,3	2	0,75	0,5
	×					
						$\rightarrow j^* = 1$

Example: construction (1/1)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$	1	0	0	0	0	.
	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
$a_{ij} =$	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	3	4	3	3	4	2
$u(x_j) =$	2,3	0,5	1,3	2	0,75	0,5
	×					

$\rightarrow j^* = 1$

Example: construction (2/2)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$	1	0	0	0	0	.
	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
$a_{ij} =$	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	—	—	—	—	—	2
$u(x_j) =$	—	—	—	—	—	0,5
					\times	$\rightarrow j^* = 6$

Example: construction (2/2)

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$	1	0	0	0	0	1
	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
$a_{ij} =$	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	—	—	—	—	—	2
$u(x_j) =$	—	—	—	—	—	0,5
					\times	$\rightarrow j^* = 6$

Improvement Algorithm (Deepest Descent Method)

Algorithm 2: Local search algorithm (for minimization)

S , a feasible solution

localOptimum \leftarrow false

repeat

 Choose $S' \in \mathcal{N}(S)$ with $f(S') < f(S)$

if found(S')

$S \leftarrow S'$

else

 localOptimum \leftarrow true

endif

until localOptimum

return S

Example: improvement (1/2)

A solution x ($x_j = (0, 1), j = 1, \dots, n$) :

- ▶ move:

kp-exchange :

k variables at 1 switched to 0 and p variables at 0 switched to 1

- ▶ relevant values of kp for WSPP:

0-1-exchange

1-1-exchange

1-2-exchange

2-1-exchange

etc.

Example: improvement (2/2)

1-1-exchange:

$j =$	1	2	3	4	5	6	
$c_j =$	7	2	4	6	3	1	
$x_j =$	1 ↘	0	0 ↗	0	0	1	$\rightarrow z(x) = 8$
$a_{ij} =$	1	1	1	0	0	0	$\sum_{j \in J} a_{ij} x_j = 1$
	0	1	0	0	1	1	$= 1$
	1	1	0	1	0	0	$= 1$
	0	1	1	0	1	0	$= 0$
	0	0	0	1	0	1	$= 1$
	0	0	1	1	1	0	$= 0$
	1	0	0	0	1	0	$= 1$

Exercise 2

- ▶ **Search a very “good” feasible solution with GRASP¹**

Iterative procedure: alternance between (1) greedy random construction and (2) local search.

¹**GRASP**: Greedy randomized adaptative search procedure. Introduced by Th. Féo and M. Resende in 1989. Central idea : (Deepest) multistart descent method with initial solutions blending greedy and random.

GRASP Algorithm

Parameters :

- ▶ $\alpha \in [0, 1]$, the compromise between greedy and random.
- ▶ stoppingRule (ex : *nIter*, a number of iterations).

Algorithm 3: GRASP metaheuristic

```
 $S^* \leftarrow \emptyset$ , the best solution found
repeat
     $S \leftarrow \text{greedyRandomizedConstruction}(\text{problem}, \alpha)$ 
     $S' \leftarrow \text{localSearchImprovement}(S)$ 
     $\text{updateSolution}(S', S^*)$ 
until isFinished?(StoppingRule)
return  $S^*$ 
```

Construction algorithm

Algorithm 4: The greedy randomized construction

$S \leftarrow \emptyset$

Initialize the candidate set \mathcal{C} , and evaluate the utility $u(e)$, $\forall e \in \mathcal{C}$

while ($\mathcal{C} \neq \emptyset$) **loop**

 Build RCL, the restricted candidate list:

$u_{Limit} \leftarrow \min_{e \in \mathcal{C}} u(e) + \alpha * (\max_{e \in \mathcal{C}} u(e) - \min_{e \in \mathcal{C}} u(e))$

$RCL \leftarrow \{e \in \mathcal{C}, u(e) \geq u_{Limit}\}$

 Select an element e from the RCL at random:

$e \leftarrow \text{RandomSelect}(RCL)$

 Incorporate e into the solution:

$S \leftarrow S \cup \{e\}$

 Update the candidate set \mathcal{C} and reevaluate the utility $u(e)$, $\forall e \in \mathcal{C}$

$\mathcal{C} \leftarrow \mathcal{C} \setminus \text{conflict}(\{e\})$

endWhile

return S

GRASP : Greedy Randomized Adaptative Search Procedure

Exemple (Con't)

$$\left[\begin{array}{lcl} \max z & = & 7x_1 + 2x_2 + 4x_3 + 6x_4 + 3x_5 + x_6 \\ s/c & & \begin{array}{l} x_1 + x_2 + x_3 \leq 1 \\ x_2 + x_5 + x_6 \leq 1 \\ x_1 + x_2 + x_4 \leq 1 \\ x_2 + x_3 + x_5 \leq 1 \\ x_4 + x_6 \leq 1 \\ x_3 + x_4 + x_5 \leq 1 \\ x_1 + x_5 \leq 1 \end{array} \\ & & x_1, x_2, x_3, x_4, x_5, x_6 = (0, 1) \end{array} \right]$$

With $\alpha = 0.70$

Example: construction

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$
$a_{ij} =$	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0
$\sum_{i \in I} a_{ij} =$	3	4	3	3	4	2
$u(x_j) =$	2, 3	0, 5	1, 3	2	0, 75	0, 5

Example: construction

$j =$	1	2	3	4	5	6
$c_j =$	7	2	4	6	3	1
$x_j =$
$a_{ij} =$	1	1	1	0	0	0
	0	1	0	0	1	1
	1	1	0	1	0	0
	0	1	1	0	1	0
	0	0	0	1	0	1
	0	0	1	1	1	0
	1	0	0	0	1	0

Selection n 1:

$$\sum_{i \in I} a_{ij} = \begin{matrix} 3 & 4 & 3 & 4 & 3 & 2 \\ u(x_j) = & \textcolor{green}{2,3} & 0,5 & 1,3 & 2,0 & 0,75 & \textcolor{red}{0,5} \end{matrix} \Rightarrow u_{Limit} = 1,76$$

\times
 \times

$$\text{RCL : } \begin{matrix} 1 & 4 \end{matrix} \rightarrow j^* = 4$$

$$u_{Limit} = 0,7 \times (2,3 - 0,5) + 0,5 = 1,76$$

Example: output
